

LETTER OF ACCEPTANCE

Paper ID – ICICCS_374

Title – Blood Group Detection By Finger Print Based DeepLearning: A Comparative Study

Author(s) - Ramesh Dadi, Gaddam sai, Thangallapally Vikas, Adapala VamshiKrishna

Dear Author(s)

Hearty Congratulations,

We are pleased to inform you that your paper entitled **“Blood Group Detection By Finger Print Based DeepLearning: A Comparative Study”** was peer-reviewed and has been accepted for the presentation at the 2026 International Conference on Intelligent Computing and Control Systems (ICICCS). The conference will be held at Nandha Engineering College, Erode, Tamil Nadu, India between 16 – 18 March 2026.

In this regard, we appreciate if you could send the final paper, copyright form and payment proof to the conference at the earliest, to ensure a timely publication of your research paper. When submitting your final paper, please highlight the changes made to the research paper according to the specified reviewer comments.

Please feel free to contact us if you have any questions or require further information regarding the conference. Once again, on behalf of the conference committee we extend our warm gratitude to welcome you at our conference.

Please find the technical review comments at the bottom of this letter.

Organizing Chair - ICICCS 2026

Dr. C. N. Marimuthu

Dean, Research and Development,

Nandha Engineering College,

Erode, India.

REVIEW COMMENTS

Decision: ACCEPTANCE WITH MAJOR REVISION.

Title: Blood Group Detection By Finger Print Based DeepLearning: A Comparative Study

Review Comments 1:

1. How was class imbalance addressed, particularly for the rare blood groups AB- and O-?
2. Authors should specify the attention mechanism used and where it is applied in the CNN-LSTM pipeline.
3. Clarify the CNN + multi-attention + LSTM model was compared against simpler baselines under identical settings.
4. Kindly report fingerprint sample counts per blood group and class distribution across ABO and Rh categories.
5. Include the average inference time per fingerprint image and If experiments used CPU or GPU
6. Mention 4-5 keywords at the end of the abstract section.
7. All the references should be cited in the article content.
8. All the figures and tables should be numbered, captioned and cited in the article content (for example, "As shown in Fig. 1, Figure 2 shows, As shown in Table I,
9. Table II demonstrates etc.").
10. Redraft conclusion into a single paragraph in around 150-200 words.

Review Comments 2:

1. Why is data augmentation important for improving model generalization in this study?
2. How do CNN layers extract ridge texture and orientation features from fingerprint images?
3. Why are attention mechanisms added to CNN feature maps in the proposed model?
4. How does the attention mechanism help the model focus on discriminative fingerprint regions?
5. Why is an LSTM layer used to model ridge flow sequences across fingerprint segments?
